How to view the map and precautions

The range and depth of floodwaters shown on the map are calculated results and there may be floods in areas not expected to flood or the actual depth may differ from the expected depth.

About the Flooding Hazard Map

This map summarizes the information useful for evacuation to evacuation sites when there is flooding or expected conditions for inundations if there is high waters due to extensive rain in the Nikko River, Shinkawa River basin streams, Shonai River and tributaries of Kiso River that causes levees to overflow or burst.

Map Creation Method

- This map was created by overlaying all results of a simulation of an expected maximum rainfall in each river basin (a once in 1000 years level of rainfall).
 Nikko River basin: Flood prediction published by Aichi prefecture in September 2019 total 24-hour rainfall 713mm
 Shonai River basin: Flood prediction published by national authorities in March 2020 total 24-hour rainfall 578mm
 Shinkawa River basin: Flood prediction published by Aichi prefecture in May 2020 total 24-hour rainfall 751mm
 Gose River basin: Flood prediction published by Aichi prefecture in April 2020 total 24-hour rainfall 790mm
- The range and depth of floodwaters shown on the map is overlaid with calculated results for the range of flooding when a river levee breaks. The maximum flood depth was selected and is indicated by color.
